

ABSTRACT

A child support device (10) comprising a base section (12) to provide a resting area (14) for a child (16). A harness means (18) is attached to the base section (12) to retain the child within the resting area. The base section (12) is laterally rigid so that the device (10) remains stable when the child is harnessed within the resting area (14). The base section comprises a first section (26), a second section (28) and a head section (30).
